## AMENDMENTS TO THE CLAIMS

 (Currently Amended) A method for generating an encrypted user data stream, which has a header and a user data block, comprising the following steps:

generating the header; and

generating the user data block, which follows the header, by means of the following substeps:

using [[a]] the first part of the user data as an unencrypted start section for the user data block, the unencrypted start section remaining unencrypted;

encrypting a second part of user data which follows the first part of the user data to obtain encrypted user data; and

appending the encrypted user data to the unencrypted start section.

wherein the unencrypted start section of the user data is placed immediately after the header.

(Currently Amended) A method according to claim 1, wherein the step of generating the header includes the following substep:

entering the length of the unencrypted start section in the header.

 (Original) A method according to claim 1, wherein the second part does not comprise all the user data to be encrypted and wherein the step of generating the user data block includes the following substep:

Attorney Docket No.: SCHO0113

appending a third part of user data to be encrypted, which follow the second part, to the encrypted user data of the second part, the user data of the third part being unencrypted.

- (Previously Presented) A method according to claim 1, wherein the step of generating the header includes the following substep:
  - entering the length of the encrypted user data of the second part which are encrypted, in the header.
- (Previously Presented) A method according to claim 3, wherein the step of generating the header also includes the following substep:
  - entering the sum of the length of the encrypted user data, which correspond to the second part, and the length of the third part of the unencrypted user data in the header.
- 6. (Currently Amended) A method for playing back an encrypted multimedia user data stream, which has a header and a user data block, where an unencrypted start section of the user data block, which is placed immediately after follows the header, contains unencrypted comprises the first part of the user data in an unencrypted form, and where a further section of the user data block contains comprises a second part of the encrypted user data in an encrypted form, where the header contains comprises information which is needed absolutely necessary to for playing back the unencrypted start section of the user data block and where the header contains also comprises information which is not needed to play back the unencrypted start section of the user data block, comprising the following steps:

<u>initially</u> processing <u>only</u> the information of the header which is needed <u>absolutely necessary for</u> te play<u>ing</u> back the <u>unencrypted</u> start section of the user data block; and

playing back the unencrypted start section of the user data block.

 (Currently Amended) A method according to claim 6, which also includes the following steps:

processing the information of the header which is not needed to play back the unencrypted start section;

decrypting the further section of the user data block using the processed information of the header <u>which is processed in the step of processing</u>; and

playing back the encrypted user data of the further section of the user data block

- (Previously Presented) A method according to claim 7, wherein the step of
  processing the information of the header which is not needed to play back
  the unencrypted start section is performed concurrently with the playing
  back of the unencrypted start section.
- (Original) A method according to claim 6, wherein the length of the unencrypted start section of the user data block is between 1 and 60 seconds.

- (Currently Amended) A method according to claim 6, wherein the user data to be encrypted are coded and wherein the information which is needed for playing back centains comprises an entry specifying the type of coding/decoding method.
- (Original) A method according to claim 1, wherein the user data are audio and/or video data.
- (Currently Amended) A device for generating an encrypted user data stream, which has a header and a user data block, comprising:

a unit for generating the header; and

a unit for generating the user data block, which follows the header, with the following features:

a unit for using a first part of the user data as <u>an unencrypted</u> start section for the user data block, the <u>unencrypted</u> start section remaining unencrypted;

a unit for encrypting a second part of the user data which follows the first part to obtain encrypted user data; and a unit for appending the encrypted user data to the unencrypted start section.

wherein the unencrypted start section of the user data is placed immediately after the header.

13. (Currently Amended) A device for playing back an encrypted user data stream, which has a header and a user data block, where an unencrypted start section of the user data block, which is placed immediately after fellows the header, centains comprises the first part of the unencrypted user data in an unencrypted form and where a further section of the user data block centains comprises a second part of the user data in an encrypted user data form, where the header centains comprises information which is needed absolutely necessary for to playing back the unencrypted start section of the user data block and where the header centains also comprises information which is not needed to play back the unencrypted start section of the user data block, comprising:

a unit for <u>initially</u> processing only the information of the header which is needed <u>absolutely necessary for</u> to playing back the <u>unencrypted</u> start section of the user data block; and

a unit for playing back the unencrypted start section of the user data block in response to the unit for processing.

 (Currently Amended) A device according to claim 13, which further comprises:

a unit for processing the information of the header which is not needed to play back the unencrypted start section;

a unit for decrypting the further section of the user data block using the precessed information of the header which is processed by the unit for processing; and

a unit for playing back the encrypted user data of the further section of the user data block.

Attorney Docket No.: SCHO0113

15. (Previously Presented) A device according to claim 14, wherein the unit for processing the information of the header which is not needed to play back the unencrypted start section is designed to be operated concurrently to the unit for playing back the unencrypted start section.

- (Original) A device according to claim 13 which is implemented as a stereo system, hifi unit, solid state player, a playback unit with a hard disk or CD ROM, or a computer.
- (Original) A device according to claim 12, wherein the user data are audio and/or video data.
- 18. (Cancelled)
